

IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application. An identifier indicating the status of each claim is provided.

Listing of Claims

1-8. (Canceled)

9. (Currently Amended) A portable memory device comprising:

a terminal capable of being connected to an interface mounted on a host machine and capable of data input/output from/to said host machine, and

a storage element for storing data which include:

at least one of image data and audio data,

reproduction program data for said host machine to reproduce at least one of said image data and audio data, and

execution program data for said host machine to execute said reproduction program using said reproduction program data and a writing program to write at least one of said image data and audio data from said host machine to said storage element in response to a detection signal indicating that said host machine detects a connection of said terminal to said interface,

wherein at least one of the image data and audio data to be reproduced is selected by a user.

10. (Previously Presented) The portable memory device as described in claim 9, wherein the host machine can activate said execution program in response to said detection signal to read and reproduce at least one of said image data and audio data stored in said memory element, when said host machine previously stores at least said reproduction program data and execution program data, and

when said terminal is connected to said interface in the state that said storage element stores at least one of said image data and audio data.

11. (Currently Amended) A recording medium for storing a computer-executable program, the program having program code comprising:

a detecting step of detecting a detection signal indicating that a terminal of the portable memory device is connected to said interface;

~~a~~an executing step of executing a program in a reproduction program data for reproducing at least one of image data and audio data stored in said memory device, in response to said detection signal; and

a writing step to write at least one of said image data and audio data from a host machine to said storage element,

wherein at least one of the image data and audio data to be reproduced is selected by a user.

12. (Currently Amended) The recording medium as described in claim 11,~~when said terminal of said portable memory device is connected to said interface and said host machine stores at least one of said image data and audio data, said reproduction program data~~

~~and said execution program data before the detecting step, before executing the detecting step,~~
~~said host machine is made to execute two steps including wherein the program has program code~~
comprising:

an outputting step of outputting at least one of said image data and audio data to
said portable memory device[[,]]; and

a controlling step of controlling to output said reproduction program data and
said execution program data to said portable memory device at the same time as, during or after
the outputting step.

13. (Currently Amended) A data processing system comprising:

a host machine having an interface capable of data input/output, and

a portable memory device comprising:

a terminal capable of being connected to said interface, and

a storage element for storing at least one of image data and audio data,
reproduction program data for said host machine to reproduce at least one of said image data and
audio data, execution program data for said host machine to execute a program using said
reproduction program data in response to a detection signal indicating that said host machine
detects a connection of said terminal to said interface, and a writing program to write at least one
of said image data and audio data from said host machine to said storage element,

wherein at least one of the image data and audio data to be reproduced is
selected by a user.

14. (Previously Presented) The data processing system as described in claim 13, said system further comprising an external apparatus connected to said host machine via a network,

wherein said host machine comprises a means for controlling to activate said execution program in response to said connection detection signal and outputting via said network at least one of said image data and audio data to said external apparatus designated by a user beforehand, when said terminal is connected to said interface in the state that at least one of said image data and audio data is stored in said storage element.

15. (Currently Amended) The portable memory device as described in claim 9, wherein said writing program, executed in said host machine, displays an icon or a reduced image of a file of image data stored in said memory device on a same display of the host machine, and writes a selected file to said memory device.
